So for authentic email validation, send a confirmation email to the user and verify if the email really exists or not. Constraint Validation HTML5 introduced a new HTML validation concept called constraint validation. Validation can be defined by many different methods and deployed in many different ways. In most cases, the purpose of data validation is to ensure the correct data entry by the user. Well, let's create an HTML file called "application-form.html" and place the next code on it, then save it somewhere on your system. Validation of HTML forms can be done using JavaScript. Server side validation is performed by a web server, after the input has been sent to the server. Tip: However, you can validate the email format using the regular expression. In the next section we will take a closer look at how to validate forms in JavaScript and handle any input errors found appropriately and gracefully. Typical validation tasks are: has the user filled in all required fields? However, to obtain the values of a form field that supports multiple selections, such as a group of It is necessary to use the loop statement as shown in the previous example (Line No. 14 to 21). In addition, to check whether the format of the input data is correct or not, we have used regular expressions. Review each line of the following sample code to understand how the validation in JavaScript works: // Define a show function Show n'(rorrEtnirp { esle } ;)"eman dilav a retne esaelP" ,"rrEeman"(rorrEtnirp {)eslaf ===)eman(tset.xeger(fi ;/$+]s\Z-Az-a[^ / = xeger rav { esle } ;)"eman ruoy retne esaelP" ,"rrEeman"(rorrEtnirp {)"" == eman(fi eman etadilaV // ;eurt = rrEredneg = rrEyrtnuoc = rrEelibom = rrEliame = rrEeman rav eulav tluafed a htiw selbairav rorre gninifeD // } } ;)eulav.]i[sexobkcehc(hsup.seibboh seulav detceles htiw yarra seibboh etalupoP // {)dekcehc.]i[sexobkcehc(fi {)++i ;htgnel.sexobkcehc < i ;0=i rav(rof ;)"]seibboh"(emaNyBstnemelEteg.tnemucod = sexobkcehc rav ;][= seibboh rav ;eulav.redneg.mroFtcatnoc.tnemucod = redneg rav ;eulav.yrtnuoc.mroFtcatnoc.tnemucod = yrtnuoc rav ;eulav.elibom.mroFtcatnoc.tnemucod = elibom rav ;eulav.liame.mroFtcatnoc.tnemucod = liame rav ;eulav.eman.mroFtcatnoc.tnemucod = eman rav stnemele mrof fo seulav eht gnivelrteR // {)(mroFetadilav noitcnuf mrof etadilav ot noitcnuf a gninifeD // } ;gsMtnih = LMTHrenni.]dImele(dIyBtnemelEteg.tnemucod {)gsMtnih ,dImele(rorrEtnirp noitcnuf egassem sti gender); } else { printError (Â"genderErrÂ", Â"Â"); genderErr = false; } // Avoid sending the form if there is any error if ((Errname â â EmailErr â l return false; } else { // Create a string from input data for preview var dataPreview = Â"You have entered the following information: Â" + Â"Full name: Â" + name + Â"Â" + Â"Email address: Â" + email + Â"Â" + Â"Mobile number: Â" + mobile + Â"Â" + Â"Country: Â" + country + Â"Â" + Â"Gender: Â" + gender + Â"Â"; if (hobbies.len (gth) { dataPreview += Â"Hobbies: Â" + hobbies.join (Â", Â"); } // Display input data in a dialog box before sending the form alert (dataPreview); } }; The value of an individual form field can be accessed and retrieved using the syntax document.formName.fieldName.value or document.getElementsByName (name).value. To learn about server-side validation, refer to the tutorial on validating PHP Forms Validation of HTML restrictions is based on: Validation of restrictions HTML Input Attributes Validation of restrictions CSS Nickname Selectors Validation of restrictions DOM Properties and Methods Restriction Validation HTML Input Attributes Description disabled Specifies that the input element must be disabled max Specifies the maximum value of an input element min Specifies the minimum value of an input element pattern Specifies the value pattern of a required input element Specifies the value pattern of a required input element Specifies that the input field requires an element type Specifies the type of an input element For a complete list, go to HTML Input Attributes. But a user can enter an email that is properly formatted but does not exist. body { font-size: 16px; background: #f9f9f9; font-family: "Segoe UI", "Helvetica Neue", Arial, sans-serif; } h2 { text-align: center; text-decoration: underline; } form { width: 300px; background: } } xp5 :mottob-nigram ;kcolb :yalpsid { lebal } ;xp5 :suidar-redrob ;0 otua xp05 :nigram ;ccc# dilos xp1 :redrob ;xp04 xp04 xp51 :oneller i {Color: # 999; Sound size: 80%; } Input, select {Border: 1px Solid #CCC; Filling: 10px; screen lock; Width: 100%; Size of the box: Border-Box; Border radius: 2px; } .Row {padding-bottom: 10px; } .Form-Inline {Border: 1px Solid #CCC; filling: 8px 10px 4px; Border radius: 2px; }. Label in shape, entry. On-line entry {Screen: Online Block; Width: Auto; Right filling: 15px; } .Error {Color: Red; Sound size: 90%; } Input [TYPE = "Send"] {Source size: 110%; Source weight: 100; Background: # 006DCC; Border color: # 016BC1; Box shadow: 0 3px 0 # 0165B6; Color: #fff; Top margin: 10px; cursor: pointer; } Enter [Type = "Send"]: Hover {Fund: # 0165B6; } That's it, now opens the "application-form.html" file in a web browser and try to complete some data and see how the script responds when data is entered not valid in a form field. Understanding the customer side validation web forms have become an essential part of web applications. Note: Validation on the client side is not a substitute or alternative for validation on the server side. Form Validation with JavaScript The process of validation of the form generally consists of two parts: the validation of the required fields that is done to ensure that all mandatory fields are completed and the data format validation that is done to ensure that the type and format of the data entered â €
